

## Take Control of Password Security Throughout Your Organization

Keeper's Advanced Reporting and Alerts Module (ARAM) lets you monitor employee password practices and enforce security and compliance rules.

Using Keeper's Advanced Reporting and Alerts (ARAM) module, IT and security administrators can monitor any size user population; receive real-time email, SMS text, or webhooks notifications of unusual or potentially risky behaviors; and run custom reports for compliance purposes.

This powerful module leverages the same strict zero-knowledge architecture as the rest of the Keeper platform.

### Get Real-Time Notifications of Security Events

Using ARAM, IT and security admins can get real-time notifications via email, SMS text, or webhooks about security events that could indicate security policy or compliance violations, such as:

- A user disabling multi-factor authentication (2FA).
- A user setting a weak password or reusing a password.
- A user sharing a password.
- Keeper BreachWatch™ events, including when users are notified of high-risk passwords and when they have resolved the issue.

You can customize alert thresholds to avoid alert fatigue to only deliver the notifications you want, with the details that are most important, to the people who need to get them.

Alerts can be delivered via email or SMS text, or use Keeper webhooks to push alerts to Slack, Microsoft Teams, or your security information and event management (SIEM) solution.

### Monitor Password Usage Organization-Wide

Use the ARAM Reporting & Alerts Dashboard to get the big picture of what's going on with password security throughout your organization. The Reporting & Alerts Dashboard displays the most common security events that occur in your environment, with trend lines to indicate whether the events are normal or indicate a spike in a particular kind of activity.

### Create Custom Reports for Internal Use or Compliance Audits

Use the ARAM Reporting Engine to create custom, time-based reports for internal use, compliance audits, or both.

- Over 100 event types broken down by category, such as Security Events, Administrative Actions, or General Usage.
- Filter on User, Event Type, or Attribute (e.g., Record UID, Shared Folder UID, or Geolocation).

### Export Security Event Data to SIEMs or Spreadsheets

Automatically feed real-time event data into an external spreadsheet or SIEM solution, using webhooks to send only the events you want to export. Currently supported SIEMs include:

### Easy to Use & Maintain

Set it and forget it! ARAM is designed to be easy to use and maintain. There's no scripting, REGEX, or syslog configuration required, and once you've set everything up, everything else is automated.

Keeper's ARAM module is available as an add-on for Keeper Business and Keeper Enterprise customers. Start a free trial of the ARAM Module by contacting [sales@keepersecurity.com](mailto:sales@keepersecurity.com).
